Drum Dial

Drum Dial quickly and precisely tunes all drums by accurately measuring drumhead tension NOT tension rod torque. Tension rod torque can be used to tell you when you are over tightening a bolt to prevent thread damage, but is not accurate for drum tuning because of the difference in screw tolerances, plating, corrosion, and thread wear.

You can eliminate these problems by using a Drum Dial to measure drumhead tension directly from the drumhead, allowing you to precisely tune your drums faster and easier than ever before. Drum Dial has been designed and manufactured to the highest quality standards with all the key features you would expect from the best drum tuner available. Get the tuner that really works, get a Drum Dial and make it possible for your drums to consistently sound great!

Each Drum Dial comes with an instruction guide, tuning is a very personal thing, you are given suggestions to get you started from then on it's up to you.

Drum Dial Features:

1. Heavy weight base for "Superior Accuracy".
2. Adjustable Bezel for "Zeroing Out".
3. Bezel lock.
4. Tuning range memory markers.
5. "Edge Guide" for edge distance accuracy.
